

# When Words Save Watts

## Government Communication and Household Electricity Use

Marie Bruguet

Université Paris Dauphine - PSL

Chaire Économie du Climat

Sous-Direction des Statistiques de l'Énergie, CGDD

June, 2026 - AFSE

# Introduction

Figure: Incentives for Energy Conservation

# Introduction

Figure: Incentives for Energy Conservation

- Residential sector account for 40% of France total electricity consumption
- Residential electricity consumption dropped by 10% (10 TWh) between 2019-21 and 2022-23

# Introduction

Figure: Incentives for Energy Conservation

- Residential sector account for 40% of France total electricity consumption
- Residential electricity consumption dropped by 10% (10 TWh) between 2019-21 and 2022-23

# Introduction

## Research Question

To what extent can government communication shape household electricity consumption ?

---

# Introduction

## Research Question

To what extent can government communication shape household electricity consumption ?

---

- 1 Does government communication influence public attention?

## Research Question

To what extent can government communication shape household electricity consumption ?

---

- 1 Does government communication influence public attention?
- 2 Does public attention have an impact on household electricity consumption?

# Insights from Literature

- Most of the economic literature on incentives for energy conservation relies on **strictly controlled experiments or theory** ; estimate energy decrease ranging from 2 to 7 %  
(Abrahamse et al., 2005; Delmas et al., 2010; Andor and Fels, 2018; Blasco and Gangl, 2023)

# Insights from Literature

- Most of the economic literature on incentives for energy conservation relies on **strictly controlled experiments or theory** ; estimate energy decrease ranging from 2 to 7 %  
(Abrahamse et al., 2005; Delmas et al., 2010; Andor and Fels, 2018; Blasco and Gangl, 2023)
- A smaller share of empirical literature study **large-scale natural experiments** that derive from energy crisis; estimate energy decrease ranging from 2 to 8 %
  - ▶ Reiss and White (2008) (*California energy crisis 2000-01*)
  - ▶ He and Tanaka (2023) (*Fukushima nuclear accident 2011*)
  - ▶ Jamissen et al. (2024) and Behr et al. (2025) (*European energy crisis 2022-23*)

# Insights from Literature

## This paper : France during the *European energy crisis 2022-23*

Government Communication → Public Attention → Electricity consumption

# Background

- 1946: Creation of a state-owned monopoly (*Électricité de France*, EdF)

# Background

- 1946: Creation of a state-owned monopoly (*Électricité de France*, EdF)
- 2007: Market opened to competition for production and distribution

# Background

- 1946: Creation of a state-owned monopoly (*Électricité de France*, EdF)
- 2007: Market opened to competition for production and distribution
- 2022-23 : A single electricity retailer covers 93% of the market (*Enedis*)

# Background

- 1946: Creation of a state-owned monopoly (*Électricité de France*, EdF)
- 2007: Market opened to competition for production and distribution
- 2022-23 : A single electricity retailer covers 93% of the market (*Enedis*)
- Two types of electricity retail prices:
  - ▶ **Regulated Tariff:** 62%
  - ▶ **Market-based Tariff:** 38%

Figure: France Electricity Market and Regulated Prices

# Background

## Context

Russo-Ukrainian war + Corrosion issues in the nuclear fleet → Supply constraints and price volatility

# Background

## Context

Russo-Ukrainian war + Corrosion issues in the nuclear fleet → Supply constraints and price volatility

**Monetary:** A tariff shield

**Table:** Regulated Tariff Decisions

| Period  | Observed Prices<br>(€/MWh) | Recommended Prices (CRE)<br>(€/MWh) |
|---------|----------------------------|-------------------------------------|
| 2019-21 | 98                         | 98                                  |
| 2022-23 | 183<br>(+88%)              | 253<br>(+160%)                      |

*Notes :* Observed prices reflect actual tariffs applied to consumers, incorporating the government's tariff shield. Regulated prices (CRE) show the Energy Regulatory Commission's recommended tariffs absent intervention.

# Background

## Context

Russo-Ukrainian war + Corrosion issues in the nuclear fleet → Supply constraints and price volatility

**Monetary:** A tariff shield

Table: Regulated Tariff Decisions

| Period  | Observed Prices<br>(€/MWh) | Recommended Prices (CRE)<br>(€/MWh) |
|---------|----------------------------|-------------------------------------|
| 2019-21 | 98                         | 98                                  |
| 2022-23 | 183<br>(+88%)              | 253<br>(+160%)                      |

Notes : Observed prices reflect actual tariffs applied to consumers, incorporating the government's tariff shield. Regulated prices (CRE) show the Energy Regulatory Commission's recommended tariffs absent intervention.

**Non-Monetary :** Load control and Communication

- **Load control:** *Enedis* has been authorised to remotely control the water heaters in 4 million households (12% of contracts) [▶ Load Control](#)
- **Communication:** Public appeal from government members (350 public statements in 2 years) + Televised information campaign

# Identification Strategy

Figure: Directed Acyclic Graph (DAG)

**Table:** Average Annual Electricity Consumption

|                                         | Base      |           | ToU       |           |
|-----------------------------------------|-----------|-----------|-----------|-----------|
|                                         | 2019–2021 | 2022–2023 | 2019–2021 | 2022–2023 |
| <b>Panel A. Aggregate Consumption</b>   |           |           |           |           |
| Total consumption (TWh)                 | 51.0      | 49.9      | 97.7      | 85.0      |
| Number of contracts (millions)          | 17.6      | 18.0      | 14.5      | 14.6      |
| Consumption per contract (MWh)          | 2.9       | 2.8       | 6.7       | 5.8       |
| <b>Panel B. End-Use Composition (%)</b> |           |           |           |           |
| Heating                                 | 25        |           | 48        |           |
| Hot water                               | 35        |           | 24        |           |
| Refrigeration                           | 21        |           | 10        |           |
| Cooking                                 | 10        |           | 6         |           |
| Other appliances                        | 9         |           | 12        |           |

- Two representative households ► Tariff by profiles
  - Base profile have a constant €/MWh tariff within a day
  - ToU profile have a bi-variate €/MWh tariff within a day

## Government Communication

Daily collection of public speeches from [www.vie-publique.fr](http://www.vie-publique.fr) + Public Interest Advertisement from *Institut National de l'Audiovisuel*

← Discours

**Déclaration de Mme Élisabeth Borne, Première ministre, sur le plan de sobriété énergétique et l'objectif de baisser de 10 % la consommation d'énergie en deux ans, Paris le 6 octobre 2022.**

Économie

Prononcé le 6 octobre 2022

Intervenant(s) : [Élisabeth Borne](#) - Première ministre

**Figure:** Government Communication on Public Attention - Energy Conservation

## Attention to Energy Conservation

Household paying attention on how to save energy because of economic uncertainty

**Figure:** Government Communication on Public Attention - Energy Crisis

## Attention to Energy Crisis

Household paying attention to the crisis because of potential blackout

# Data

Figure: Daily Attention for Energy Topics

## Econometric Framework

## RECM (Restricted Error Correction Model)

$$\Delta e_{i,t} = \underbrace{\phi_i \left( e_{i,t-1} - \sum_{j=1}^k \theta_j x_{j,i,t-1} \right)}_{\text{Correction towards long-term equilibrium}} + \underbrace{\sum_{s=1}^{p-1} \lambda_i \Delta e_{i,t-s}}_{\text{Inertia of } e} + \underbrace{\sum_{j=1}^k \sum_{l_j=0}^{q_j} \delta_{j,l_j} \Delta x_{j,i,t-l_j}}_{\text{Short-term effects of } x_j} + \epsilon_{i,t} \quad (1)$$

- $e$  : Seasonally adjusted electricity consumption for a representative household (kWh/day)
- $x_{m(g)}$  : Moving average of attention (attention/day)
- $x_{P_e}$  : Variable part from price (EUR/MWh)

## Econometric Framework

## RECM (Restricted Error Correction Model)

$$\Delta e_{i,t} = \underbrace{\phi_i \left( e_{i,t-1} - \sum_{j=1}^k \theta_j x_{j,i,t-1} \right)}_{\text{Correction towards long-term equilibrium}} + \underbrace{\sum_{s=1}^{p-1} \lambda_i \Delta e_{i,t-s}}_{\text{Inertia of } e} + \underbrace{\sum_{j=1}^k \sum_{l_j=0}^{q_j} \delta_{j,l_j} \Delta x_{j,i,t-l_j}}_{\text{Short-term effects of } x_j} + \epsilon_{i,t} \quad (1)$$

- $e$  : Seasonally adjusted electricity consumption for a representative household (kWh/day)
- $x_{m(g)}$  : Moving average of attention (attention/day)
- $x_{P_e}$  : Variable part from price (EUR/MWh)
- $x_{load}$  : Binary variable equal to 1 during periods of load control implemented by the grid operator
- $x_{load} \cdot x_{m(g)_{k,n}}$  : Interaction with attention variables capturing the effect of load control on attention-induced electricity demand adjustments

## Econometric Framework

## RECM (Restricted Error Correction Model)

$$\Delta e_{i,t} = \underbrace{\phi_i \left( e_{i,t-1} - \sum_{j=1}^k \theta_j x_{j,i,t-1} \right)}_{\text{Correction towards long-term equilibrium}} + \underbrace{\sum_{s=1}^{p-1} \lambda_i \Delta e_{i,t-s}}_{\text{Inertia of } e} + \underbrace{\sum_{j=1}^k \sum_{l_j=0}^{q_j} \delta_{j,l_j} \Delta x_{j,i,t-l_j}}_{\text{Short-term effects of } x_j} + \epsilon_{i,t} \quad (1)$$

- $e$  : Seasonally adjusted electricity consumption for a representative household (kWh/day)
- $x_{m(g)}$  : Moving average of attention (attention/day)
- $x_{P_e}$  : Variable part from price (EUR/MWh)
- $x_{load}$  : Binary variable equal to 1 during periods of load control implemented by the grid operator
- $x_{load} \cdot x_{m(g)_{k,n}}$  : Interaction with attention variables capturing the effect of load control on attention-induced electricity demand adjustments
- $x_{control}$  : fixed part from price (EUR/MWh) (Auray et al., 2019); Heating Degree Days (15C); Binary variable for lockdowns

# Price Elasticity

## • Benchmark in the Literature

- ▶ Residential energy demand is typically found to be **price-inelastic**
- ▶ Consensus range: **[0.25 ; 0.80]**  
(Hanemann et al., 2013; Auray et al., 2019; Alberini et al., 2019; Frondel et al., 2019; Ewald et al., 2021; Pellini, 2021)

Table: Estimates - Price and Temperature

| Variable     | Base                  |                   | ToU                   |                      |
|--------------|-----------------------|-------------------|-----------------------|----------------------|
|              | Elast.                | Wh/day            | Elast.                | Wh/day               |
| Intercept    |                       | 4,459***<br>(939) |                       | 14,236***<br>(1,610) |
| Price        | 0.1624***<br>(0.0459) | -10.9***<br>(3.1) | 0.2112***<br>(0.0347) | -32.8***<br>(5.4)    |

# Attention Estimate

- **Margins of adjustment for households**

- ▶ Heating
- ▶ Domestic hot water

- **Attention to Crisis (Blackout)**

- ▶ Elasticity is significant and homogeneous across groups
- ▶ 1 unit of increase in attention reduces consumption by 20 to 50 Wh/day

- **Attention to Conservation**

- ▶ Base : not significant; low flexibility
- ▶ ToU : large but imprecise effect

**Table:** Estimates - Conservation and Crisis Attention

| Variable                           | Base                 |                   | ToU                   |                      |

# Attention Estimate and Crowding Effect

- Load control systems mechanically reduce consumption (11am - 2pm)
- Model re-estimated excluding load control hours to isolate true behavioral flexibility

# Attention Estimate and Crowding Effect

- Load control systems mechanically reduce consumption (11am - 2pm)
- Model re-estimated excluding load control hours to isolate true behavioral flexibility

## Findings

ToU households show significant and substantial flexibility when not mechanically constrained

*Confirmed by heterogeneity analysis: households with less load control respond more significantly to attention*

► Robustness

Figure: National residential electricity decrease decomposition

# Conclusion

## Research Question

To what extent can government communication shape household electricity consumption?

- **Communication framing matters**

Without a salient crisis framing, attention to conservation gradually declines

- **Flexibility is a necessary condition**

Only households with a remaining margin to adjust can translate attention into actual savings

## Takeaway

*Words save watts when salience drives attention and flexibility enables action*

# Thank you for your attention !

Figure: Main Regressors - (Off-Peak)

When an attention variable  $x_m$  enters both directly and through interaction with the load-control dummy  $x_{load}$ , the specification is:

$$e_t = \dots + \beta_m x_{m,t} + \beta_{m \times load} (x_{m,t} \times x_{dry,t}) + \epsilon_t. \quad (3)$$

**Short-run effects:**

$$\hat{x}_m = \beta_m \quad (x_{load} = 0), \quad \hat{x}_{m+load} = \beta_m + \beta_{m \times load} \quad (x_{load} = 1).$$

**Long-run effects (RECM multipliers):**

$$\hat{x}_m^{LR} = -\frac{\beta_m}{\phi}, \quad \hat{x}_{m+load}^{LR} = -\frac{\beta_m + \beta_{m \times load}}{\phi}, \quad (4)$$

*Standard errors obtained using the delta method*

## Contracted power (kVA)

- Maximum electricity capacity available at any point in time
- Higher contracted power allows for more simultaneous electricity usage
- Low power (6 kVA): Household in a smaller type of housing, with lower-income and no children
- High power (9-12 kVA): Household in a larger type of housing, with higher-income households and 2 to 5 children

Table: Dwellings and Household Characteristics
